

# **USER MANUAL**

**BATTERY TESTER**

# 01 FOREWORD

---

## Related knowledge

---

The batteries will gradually age over time after being made. As the battery electrode plate surface age and produces sulfides, the batteries can not undergo the chemical reactions effectively, this is the main reason the most batteries cannot continue to be used. At this time, the internal resistance of the batteries increases. The older batteries, the greater the internal resistance. By accurately measuring the value of internal resistance, you can determine the aged of the batteries. Currently, conductance method is the most advanced method to measure the internal resistance of the batteries.

It has a proven result of electric conductance test and 1/2 CCA discharging measurement test can be identical. Given result fully shows the accuracy of this tester. During operation, avoiding large current to discharge the battery can protect the battery from possible damages and heat generation. This allow the machine operator perform tests several times within a short time period. In recent years, the conductance method to measure the internal resistance of a battery is being widely used around the world.

# ABOUT Technical parameters **02**

---

The tester can detect out the battery's voltage(V), cold cranking ampere(CCA), battery life(%), internal resistance( $m\Omega$ ) and the state of health(%) in 5 seconds, it can also detect out if the battery needs to be charged or damaged. The tester suitable for automotive start system and charging system, convenient and practical.

**Applications:** Suitable for 12/24V automotive batteries (Ordinary, AGM, GEL), automotive start system and charging system test. Suitable for CCA, DIN, IEC, EN, JIS Standard batteries and unknown standard batteries.

**Voltage range:** DC 9-30V

**Working temperature:** 0-40°C

**Working humidity:** 20%-80%

**Paper:** Thermal paper

**Language:** English(US), Chinese (Simplified)

**Screen parameter:** LCD, LED backlit, resolution 128×64

**Case material:** ABS, TPR rubber cover

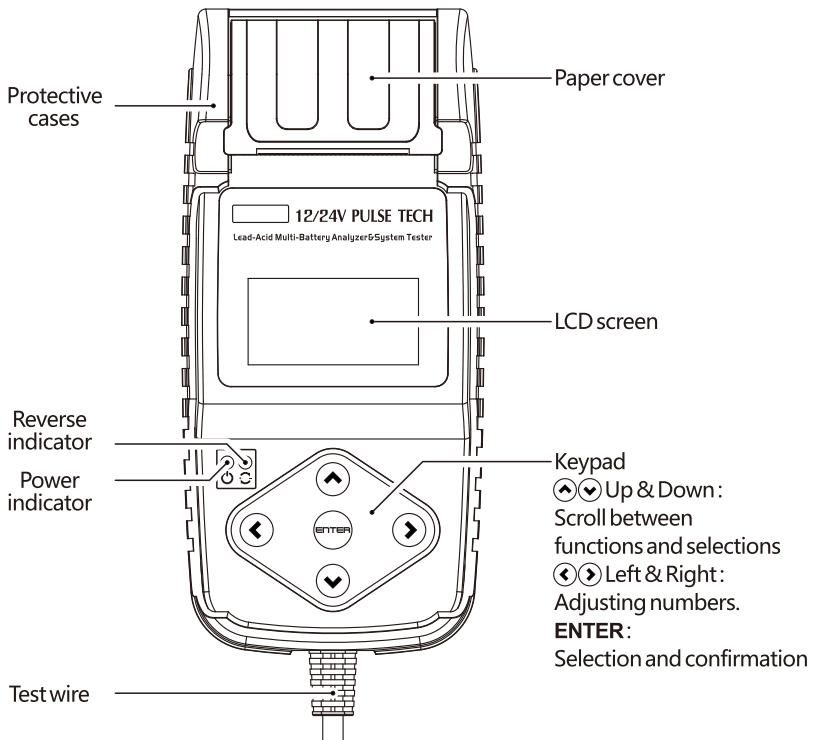

**Wire:** PVC material, 20AWG/4 wire, length1100mm

**Dimension:** 122×256×56mm

**Gross weight:** 1.0kg

# 03 INTRODUCTION

## Part names and functions

List of products :

- Battery tester (Thermal paper inside)
- Thermal paper×1 (Φ 40mm, width: 57mm)
- User manual

# PREPARATION

# Precautions **04**

- The tester is designed to test 12/24 volt automotive batteries. It can not be used for other batteries.
- A freshly charged battery will show a higher voltage than normal voltage; if this is the case, switch on the headlights for two or three minutes to allow the voltage to stabilize.
- Always connect directly to the leads of the battery terminals; connection to a remote post or vehicle ground will affect test result.
- Always connect single battery; read the user manual carefully and use correctly.

## Battery Suitability

- CCA — 100-1700
- IEC — 100-1000
- EN — 100-1700
- DIN — 100-1000
- JIS — 26A17-245H52

CCA — Cold Cranking Ampere

IEC — International Electrotechnical Commission

EN — European Industrial Standard

DIN — German Institute for Standardization

JIS — Japanese Industrial Standard

### Note:

The common battery abbreviations turn to Appendix 1;  
The conversion tables of battery size range turn to Appendix 2.

# 05 SYSTEM SETTINGS

## Time / Language setting

Connect the tester to the battery, red clip to the positive electrode and black clip to the negative electrode. The analyzer will start automatically and show the voltage of the battery. If the reverse indicator lights, that means the clip connect the wrong electrode.

### Time Setting

Press and hold the **UP** key before connecting the battery, the screen will show the time setting interface. Use **LEFT** and **RIGHT** keys to select the options, **UP** and **DOWN** keys to adjust the value, **ENTER** key to confirm.

### Language Setting

Select the **LANGUAGE** option, then press **ENTER**. Use **UP** and **DOWN** keys to select the language and **ENTER** key to confirm. The tester will record the last used language and each boot without re-selection.

# BASIC OPERATIONS

## Main menu / Battery test 06

### Main Menu

The screen will show the voltage of the battery when the analyzer starts. Use **LEFT** and **RIGHT** keys to select 12V or 24V according your battery. Then press **ENTER** to access the **MAIN MENU**.

There are three sub-menus:

**BATTERY TEST, SYSTEM TEST** and **LANGUAGE**.

BATTERY VOLTS  
12. 61V  
12V 24V  
PRESS<ENTER>

MAIN MENU  
1. BATTERY TEST  
2. SYSTEM TEST  
3. LANGUAGE

### Battery Test

- Vehicle's ignition is switched OFF and all electrical equipment is OFF.

- Select **BATTERY TEST** then press **ENTER**.  
If the battery voltage capacity is too low, the tester will display a warning, it is recommended to charge the battery to achieve an accurate assessment of the battery condition.  
Press **ENTER** to continue.

- Select the battery capacity rating standard and capacity, use **UP** and **DOWN** keys to switch between options, **LEFT** and **RIGHT** keys to change the option or adjust the value.  
Then press **ENTER** to continue.

SELECT RATING  
SET CAPACITY  
CCA  
500

# 07 BASIC OPERATIONS

## Battery test

- Press **ENTER** again to start the test, or press **UP** key to return to the last step and re-enter the value.

- The results will be shown on the screen in two pages, use **UP** and **DOWN** key to turn the page:

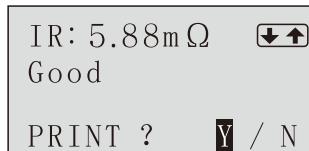

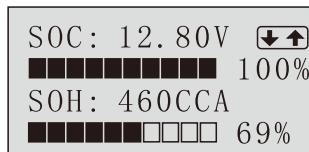

SOC: State of Charge

SOH: State of Health

IR: Internal Resistance.

Status: Status of the battery which is judged by SOH.

- Select if you want to print, Y to confirm, N to exit.

### State of Health (Battery Condition)

Battery Condition The result and advice	
SOH > 80%	Battery in peak condition
SOH 60%~80%	Serviceable / good
SOH 45%~60%	Poor condition, will need replacement soon
SOH < 44%	Replace battery

**Note:** If rating standard and range is unknown, please select "?". Testing result will show SOC (state of charge) and internal resistance but no the SOH (state of health) and state. If the battery capacity found on the sticker on the top of the battery is inaccurate, this will lead the SOH (state of health) inaccurate.

# BASIC OPERATIONS

## System test 08

### System Test

- Vehicle's ignition is switched OFF and all electrical equipment is OFF.
- Select **SYSTEM TEST**, press **ENTER**.
- Following the instruction on the screen, turn off all loads and start engine (the tester will skip automatically).
- Start voltage and result will be displayed. Press **ENTER** to continue.
- Press **ENTER** to start Charging System Test.

TURN OFF LOADS  
START ENGINE

CRANKING VOLTS  
9.48V      NORMAL

PRESS ENTER FOR  
CHARGING TEST

- Confirming all loads is off and press **ENTER** to continue.

MAKE SURE ALL  
LOADS ARE OFF

- Idling charging voltage and result will be displayed. Press **ENTER** to continue.

ALT. IDLE VOLTS  
13.84V      NORMAL

# 09 BASIC OPERATIONS

## System test

- Following the instruction on the screen, turn on all loads and bring engine to 2500RPM.  
Then press **ENTER** to continue.

TURN OFF LOADS  
RUN ENGINE UP TO  
2500RPM  
PRESS ENTER

- Ripple voltage and result will be displayed. Press **ENTER** to continue.

RIPPLE DETECTED  
0.44V      NORMAL

- Alt. load voltage and result will be displayed. Press **ENTER** to continue.

ALT. LOAD VOLTS  
13.49V      NORMAL

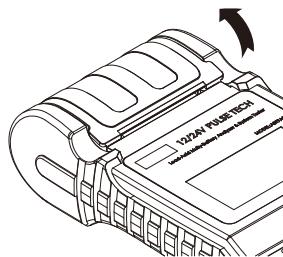

- Following the instruction on the screen, turn off engine and all loads. Press **ENTER** to finish testing and return to main menu.  
Select if you want to print, Y to confirm, N to exit.

TEST OVER, TURN  
OFF LOADS&ENGINE  
PRINT ?      Y / N

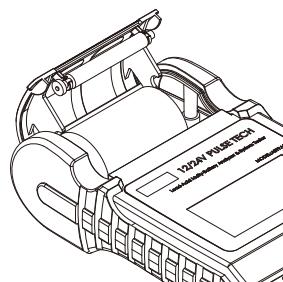

# MAINTENANCE

## Replace the thermal paper 10

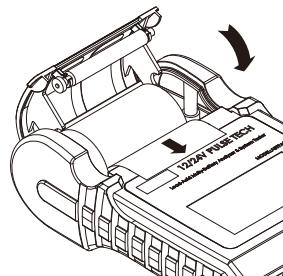

- To get access to paper roll, lift the paper cover up from tester.

- Replace the thermal paper roll.

- Pull out the head of paper and put it under the black rubber roller and close the paper cover back.

## Appendix 1: Common Abbreviation Of Batteries

**BSR** (British Standards). Continuous output on average current intensity at 0°F(-18°C), the minimum voltage can be maintained over 6.0 volts for 150 seconds.

**DIN** (German Institute for Standardization). For 100DIN, each 100DIN battery at 0°F(-18°C), the battery needs to carry 100 amperes, and over 8.0 volts for 150 seconds.

**IEC** (International Electrotechnical Commission). Continuous output on average current intensity at 0°F (-18°C), the minimum voltage can be maintained over 8.4 volts for 60 seconds.

**JIS** (Japanese Industrial Standards). Calculate with amperes / hour, 20 hour rate.

**AH** (Ampere Hour)(20 hour rate). Each 100AH battery at 80°F(27°C), the battery needs to carry 5 amperes, the minimum voltage can be maintained over 10.5 volts for 20 hours.

**RC** (Reserve Capacity)(IEC). Is the time (minute) each battery at 80°F(27°C), the average power load reach 25 amperes per minute and the minimum voltage can be maintained over 10.5 volts. For a RC 110MIN battery, the battery can provide the vehicle continued to drive 110 minutes in case of failure of the vehicle generator.

**CCA** (Cold Cranking Ampere)(IEC). Every full battery after high intensity discharge for 30 seconds, the minimum voltage can be maintained over 7.2 volts.

For a 500CCA battery, the battery needs to carry 500 amperes for 30 seconds, the minimum voltage can be maintained over 7.2 volts.

**CA** (Cranking Ampere). The significance is similar with CCA, the difference between CCA and CA is the testing temperature, CA is the result at 0 degrees Celsius. The value of CCA will be lower than CA, because the low temperatures result in poor performance of the battery.
